MEMORANDUM

TO: Joint Committee on Drinking Water Treatment Units

FROM: T. Duncan Ellison, Chairperson

DATE: April 1, 2015

SUBJECT: Proposed revision to NSF/ANSI 330 – Glossary of Drinking Water Treatment Unit Terminology (330i7r4)

Draft 4 of NSF/ANSI 330 issue 7 is being forwarded on behalf of Frank Brigano to the Joint Committee for balloting. Please review the changes proposed to these standards and submit your ballot by April 15, 2015 via the NSF Online Workspace.

Revision 4 incorporates some final suggestions to clarify that the definition of Public Health Goal is specific to the state of California. The specific values for body weight and consumption have also been removed from the definition of Lifetime Health Advisory, as these values have been changed by the EPA. Please note that if you do not return a vote for this revised ballot, your last recorded vote from the previous draft revision will remain in effect.

Purpose

The purpose of this ballot is to propose additional definitions for limit of detection (LOD) and public health goal (PHG) to be included in NSF/ANSI 330.

Background

When reviewing NSF/ANSI 330, Mr. Brigano noted two definitions that are not currently included in the glossary but that he believes are essential to the DWTU industry.

If you have any questions about the technical content of the ballot, you may contact me in care of:

3 Definitions

3.xx Lifetime Health Advisory (LHA): The concentration of a chemical in drinking water that is not expected to cause any adverse noncarcinogenic effects for a lifetime of exposure, incorporating a drinking water Relative Source Contribution (RSC) factor of contaminant-specific data or a default of 20% of total exposure from all sources. The Lifetime Health Advisory is based on exposure of a 70-kg adult consuming 2 liters of water per day. For Lifetime Health Advisories developed for drinking water contaminants before the Lifetime Health Advisory policy change to develop Lifetime Health Advisories for all drinking water contaminants regardless of carcinogenicity status in this Drinking Water Standards and Health Advisories (DWSHA) update, the Lifetime Health Advisory for Group C carcinogens (possible human carcinogen), as indicated by the 1986 Cancer Guidelines, includes an uncertainty adjustment factor of 10 for possible carcinogenicity.

Reason: Revised definition of LHA per comment received from F. Lemieux to omit specific values for body weight and consumption as these are currently being reassessed by the EPA.

3.xx Limit of Detection (LOD): The lowest quantity of a substance able to be distinguished from the absence of that substance (a blank value), but not necessarily quantified, under the conditions of the test method.

3.xx Limit of Quantification (LOQ): The lowest concentration at which the analyte is not only reliably detected but at which some predefined goals for bias and imprecision are met. The Limit of Quantification may be equivalent to the Limit of Detection or it could be at a much higher concentration.

3.xx Public Health Goal (PHG): A level of drinking water contaminant, as determined by the State of California, at which adverse health effects are not expected to occur from a lifetime of exposure. PHGs are not regulatory standards.

Reason: Added statement per comment received from F. Lemieux to clarify that PHG is a term defined by the state of California.
