Field Certification (BC-2007-7)

A. Johnson proposed to avoid a misunderstanding of the downflow velocity test procedures conducted by a certifier, which may result in the cabinet airflow to be balanced improperly.

**Motion:** A. Johnson made a motion to add language at the end of the paragraph in F.1: “Downflow velocity readings shall be taken four inches above the bottom edge of the window only when so stated on the manufacturer’s data plate label or when the manufacturers’ data plate label indicates the cabinet was listed to NSF 49-2002 or later”. J. Wagner seconded.

**Discussion:** none.

**Vote:** All in favor.

*Motion passed. Language will be balloted.*
