P. Greiner called the meeting to order, and S. Kozanecki read the NSF Antitrust Statement and took roll call.

Prior to the conference call, a copy of a report was circulated which summarized the results of CSA’s special study comparing the extraction results from a normal Section 9 evaluation to a modified procedure where the normal 4, 2-hr daily water changes (on 5 of the 7 days of the week) were exchanged with 1, 8-hr exposure (copy attached).

F. DiFolco was asked if he could characterize the products tested such as the material composition. This was unknown but F. DiFolco agreed to look into and provide the answer for the task group.

P. Greiner asked how was the 64-hour data treated (was it normalized to account for the length of the exposure or reported as extracted?). F. DiFolco confirmed that the data was from the actual 64-hour dwell time results (they were not normalized) and that the Q values were calculated from the normal pour off days only.

F. DiFolco stated that other metals tested on the Day 19 sample under both testing conditions and that there was no marked difference in the results that he could remember.

P. Greiner stated that he was encouraged to see very little difference between the 8-hour pour off and the results of the normal Section 9 protocol. F. DiFolco stated that the intent was simply to see if this warranted further study, which most agreed it did.

The group agreed to discuss the path forward during the next conference call, which was scheduled for June 2 from 2-3 pm EDT.
